

Eight metrics gate whether brokers can put home internet inside Employee Health & Benefits — start with the cheap kills

Channel under test: insurance brokerage firms include employee home connectivity in the benefits offering they already sell to employers. Prior analogy work stands: the motion only counts when a residential Spectrum Internet account opens at the employee's home. This draft sequences what to measure next. No TAM and no go-live recommendation.

Naming collision

Repo folder Decisions/EH&B means existing homes and businesses on plant already built. Kyle's note and this canvas mean Employee Health & Benefits (insurance). A broker channel that provisions residential Internet would feed existing-plant Internet net adds — it does not redefine the folder.

Already in hand — do not re-pull

Firm-size employment (SUSB 2022): US payroll employment 45.9% at firms <500 and 54.1% at 500+; states Montana 66.3% to Florida 39.6%; 387-metro median 49.8% (Analysis/small-large-employment/out/summary.json). Those shares describe the labor market. They do not tell you who buys benefits through a broker, how concentrated that book is, or whether those employees' homes sit on Spectrum plant.

Work-from-home (already requested and finished): ACS 2024 usually WFH 13.3% US (D.C. 22.9% to Mississippi 6.2%); ATUS 2024 any work at home on days worked 32.5% (management/business 48.1% vs service 10.5%); ABS 2023 share of firms with any WFH employees 35.8% (<500) vs 77.5% (500+). Cite Analysis/work-from-home/out/summary.json — do not invent a new WFH pull.

Single cheapest question that stops the offering if answered no

Cheapest kill

In the pilot states, may the insurance brokerage firm place or enroll Spectrum residential Internet as an employer benefit — or is that legally blocked so the broker can only refer?

One counsel memo. If the answer is no and no compliant referral/enrollment design survives, stop before footprint matching, take-up pilots, or contribution math. If yes only as referral, redesign the channel before sizing broker economics as if they were the seller.

Forced cut — pull these eight next

Accent marks the core set. Gray rows are demoted to later or already cited.

ID	Metric	Decision it gates	Status	Cost	Cut
M1	Broker-placed covered lives in Spectrum states	Whether a broker book even reaches employers Charter could serve	Must pull	Cheap	Core next
M2	Large-broker concentration of that book	Whether a few national brokers can move volume or the channel is fragmented	Must pull	Cheap	Core next
M3	Small-firm vs large-firm mix of broker-placed lives	Whether the broker channel skews toward employers whose workforce mix matches the offering design	Must pull	Moderate	Later
M4	Usually work-from-home / work-at-home rates	Whether the home is the workplace often enough for home internet to matter as a benefit	In repo	Cheap	Done / cite only
M5	Serviceable-home share of enrolled employees	Whether Spectrum can actually fulfill the benefit at the employee's address	Must pull	Expensive	Core next
M6	Already-adequate broadband among serviceable homes	Whether the offering meets an unserved need or only discounts a line the household already buys	Must pull	Moderate	Core next

ID	Metric	Decision it gates	Status	Cost	Cut
M7	Existing employer connectivity stipend prevalence	Whether employers already fund home internet outside brokers	Must pull	Moderate	Later
M8	Competitive home-internet presence at serviceable addresses	Whether Spectrum is the only practical home option or one of several	Must pull	Moderate	Later
M9	Payor model and enrollment take-up	Whether employers and employees will treat home internet as a benefit people actually elect	Must pull	Expensive	Core next
M10	Broker authority to place the product (unverified)	Whether the broker channel is even allowed to sell or place residential internet as a benefit	Unverified	Cheap	Core next
M11	Broker incremental revenue vs medical commission	Whether the broker has a commercial reason to sell it beside core medical	Must pull	Moderate	Later
M12	Benefits-admin provisioning path	Whether enrollment can open an ISP account without a second, broken workflow	Must pull	Cheap	Core next
M13	Net new residential Internet accounts from the channel	Whether Charter's Internet print moves, not just gross benefit enrollments	Must pull	Expensive	Core next
M14	Contribution per net new account (inputs blank)	Whether the channel is worth running after subsidy, broker pay, and job-exit churn	Must pull	Expensive	Later
M15	Work disruption from failed home connectivity	Whether the Employee Health & Benefits productivity claim can be evidenced without monitoring the pipe	Must pull	Expensive	Later
M16	Retention or recruiting lift where connectivity is offered	Whether employers see a workforce outcome worth paying for	Must pull	Expensive	Later

Source for in-repo rates: Analysis/small-large-employment/out/summary.json; Analysis/work-from-home/out/summary.json. All other values intentionally blank.

Promoted into the core set

M6 — Already-adequate broadband among serviceable homes

Promoted ahead of finer broker-book firm-size mix (M3). Employment shares already show small and large firms both matter; the offering still fails if serviceable employees mostly already have adequate broadband (especially Spectrum). That is the difference between net Internet adds and a discount on an existing line.

Demoted to later

M15 / M16 — Disruption and retention/recruiting lift

Brokers' original benefits move needed measurement, but these outcomes only become decidable after accounts exist. Privacy: proof cannot depend on monitoring how employees use the connection. Run after a provisioning pilot clears M5, M6, M9, and M12 — not as the first research spend.

Sequence — clear these gates in roughly this order

Cheap binary checks first. Expensive pilots last. Definitions below are the measurement contract; blank means not yet pulled.

1 · Does a broker book reach the right employers?

SUSB employment shares answer how the workforce splits by firm size. They do not answer broker vs direct purchase, concentration among large brokers, or the firm-size mix of a broker-placed book. Pull M1 and M2 next; hold M3 until a pilot broker is named.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M1	Broker-placed covered lives in Spectrum states	Whether a broker book even reaches employers Charter could serve	Numerator: employees covered by broker-placed medical (or full benefits) for employers with at least one worksite in a Spectrum service state. Denominator: all employees on that	No — Must pull	Not in repo. Likely: partner broker book extract; industry context from Kaiser Family Foundation Employer Health Benefits Survey (broker vs direct is often incomplete) or broker RFP data.	Cheap

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
			broker's book. Unit: percent of covered lives; also absolute lives.			
M2	Large-broker concentration of that book	Whether a few national brokers can move volume or the channel is fragmented	Numerator: covered lives at the top N broker firms (e.g., top 5 / top 10). Denominator: total broker-placed covered lives in the same geography. Unit: percent.	No — Must pull	Not in repo. Likely: Business Insurance broker rankings (revenue, not lives) plus partner disclosure — revenue rank is a proxy only.	Cheap
M3	Small-firm vs large-firm mix of broker-placed lives	Whether the broker channel skews toward employers whose workforce mix matches the offering design	Numerator: broker-placed covered lives at employers with <500 employees (enterprise). Denominator: all broker-placed covered lives in scope. Unit: percent. Distinct from SUSB payroll employment shares.	No — Must pull	Not in repo. SUSB employment shares (Analysis/small-large-employment/out/summary.json) measure the labor market, not who buys benefits through a broker.	Moderate

2 · Is the home the workplace often enough?

Already requested and finished — cite, do not duplicate. Headline rates above. Treat M4 as context for who feels home connectivity as a work tool; it is not a new core pull.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M4	Usually work-from-home / work-at-home rates	Whether the home is the workplace often enough for home internet to matter as a benefit	ACS: workers who usually worked from home ÷ workers 16+. ATUS: employed who did any work at home on days worked ÷ employed who worked. ABS: firms with any work-from-home employees ÷ firms reporting (firm-level, not worker rate). Breaks already requested: state, seniority proxy, firm size.	Yes — In repo	Analysis/work-from-home/out/summary.json and chtr-work-from-home-rates.canvas.tsx — ACS 2024 US 13.3% usually WFH; ATUS 2024 32.5% any work at home on days worked; ABS 2023 firms with WFH employees 35.8% (<500) vs 77.5% (500+).	Cheap

3 · Can Spectrum serve the address?

Hard constraint from the earlier benefits-analogy draft. Repo does not contain the serviceable-home rate for any broker book. Plant-level national figures cannot stand in for employee home addresses.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M5	Serviceable-home share of enrolled employees	Whether Spectrum can actually fulfill the benefit at the employee's address	Numerator: enrolled (or broker-covered) employees whose residential address passes a Spectrum residential serviceability check. Denominator: enrolled / covered employees in the pilot book who supply a home address. Unit: percent. Hard fail for out-of-footprint homes.	No — Must pull	Not in repo. Earlier benefits-analogy draft named footprint mismatch as a hard constraint; SUSB summary also flags no official 41-state list applied. Source: Charter plant / addressability systems × employer or broker address file.	Expensive

4 · Unserved need or only a discount?

If M6 shows almost everyone serviceable already has adequate broadband, the channel reprices existing household spend. Spectrum-on-Spectrum is cannibalization of the Internet print unless the design is explicitly retention/transfer. Stipends (M7) and competitive presence (M8) refine design after M6.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M6	Already-adequate broadband among serviceable homes	Whether the offering meets an unserved need or only discounts a line the household already buys	Numerator: serviceable employees who already have home broadband meeting a stated adequacy bar (speed/reliability threshold written in advance). Denominator: serviceable employees. Sub-cut: already Spectrum residential (cannibalization) vs other ISP (win-back / switch) vs no adequate service (true add).	No — Must pull	Not in repo. Likely: employee opt-in survey at enrollment; Charter billing match for Spectrum subset; FCC National Broadband Map is address-level availability, not subscription.	Moderate
M7	Existing employer connectivity stipend prevalence	Whether employers already fund home internet outside benefits brokers	Numerator: employers in the broker book that already pay a home-internet or remote-work stipend. Denominator: employers in that book (or covered lives	No — Must pull	Not in repo. Likely: broker client survey or benefits RFP fields; SHRM / Mercer benefits	Moderate

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
			under those employers). Unit: percent of employers and percent of lives.		benchmarking (check who funded the survey before citing).	
M8	Competitive home-internet presence at serviceable addresses	Whether Spectrum is the only practical home option or one of several	Numerator: serviceable employee homes with terrestrial fiber and/or fixed wireless also available at stated speed thresholds. Denominator: Spectrum-serviceable employee homes. Unit: percent. Overlap shares in filings (~27% AT&T / ~16% Verizon of Charter plant) are footprint mix, not this employee-address metric.	No — Must pull	Not in repo as an employee-address rate. Plant-level overlap is in Decisions materials; do not substitute plant mix for employee homes.	Moderate

5 · Will employers and employees take it as a benefit?

Name payor model and take-up as metrics to test in a pilot. No take-up rate is invented here. Medical remains the broker's core commission product; this line sits beside it, not instead of it.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M9	Payor model and enrollment take-up	Whether employers and employees will treat home internet as a benefit people actually elect	Design: share of pilot employers choosing employer-paid vs employee-paid voluntary. Take-up: enrolled internet accounts ÷ eligible employees offered the benefit, by payor model. Unit: percent. Do not invent a rate — measure in a time-boxed pilot.	No — Must pull	Not in repo. No public take-up rate for this product exists here; pilot is the source.	Expensive

6 · Does the broker have a reason — and a right — to sell it?

Licensing / placement authority is unverified in this draft. Benefits-admin provisioning (M12) is a cheap technical gate. Broker pay vs medical commission (M11) waits for a real term sheet — dollars left blank.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M10	Broker authority to place the product (unverified)	Whether the broker channel is even allowed to sell or place residential internet as a benefit	Binary by state in the pilot set: may the insurance brokerage firm place / enroll Spectrum residential Internet as an employer benefit (or only introduce / refer)? Document carrier-of-record vs broker-of-record. Mark result pass/fail per state — not a percent.	No — Unverified	Not researched in this draft. Must verify with counsel / compliance; do not treat “brokers sell benefits” as permission to sell telecom.	Cheap
M11	Broker incremental revenue vs medical commission	Whether the broker has a commercial reason to sell it beside core medical	Numerator: expected broker compensation per enrolled internet account (fee, override, or admin fee — whatever the contract states). Denominator: broker commission / fee income per covered employee from medical (or full EH&B) for the same employer. Unit: dollars per covered life and ratio. Leave dollars blank until a term sheet exists.	No — Must pull	Not in repo. Do not invent commission rates. Source: draft broker agreement + broker's disclosed medical economics for the same book.	Moderate
M12	Benefits-admin provisioning path	Whether enrollment can open an ISP account without a second, broken workflow	Binary: can the benefits administration platform pass address + consent to Charter and receive serviceable / not-serviceable / account-created statuses? Success rate in a sandbox: successful provisions ÷ enrollment attempts with complete data.	No — Must pull	Not in repo. Source: one platform partner technical spike (days to weeks).	Cheap

7 · What has to be true for Charter economics?

Contribution, not revenue. Count net new residential Internet accounts (M13) before any dollar model. Subsidy, wholesale/employer rate, broker compensation, and churn when the employee leaves stay as named inputs with blank values — none of those dollars are in the repo. Mobile adds do not offset Internet losses.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M13	Net new residential Internet accounts from the channel	Whether Charter's Internet print moves, not just gross benefit enrollments	Numerator: new Spectrum residential Internet customer relationships attributable to the benefit that were not active Spectrum residential at t-1. Denominator: benefit enrollments (or eligible serviceable employees). Unit: accounts and percent. Transfers of existing Spectrum accounts count as retention/transfer, not net adds.	No — Must pull	Not in repo. Requires billing match; no dollar model until this and M14 inputs exist.	Expensive

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M14	Contribution per net new account (inputs blank)	Whether the channel is worth running after subsidy, broker pay, and job-exit churn	Per net new account: residential contribution (revenue – direct cost) – employer/employee subsidy – broker compensation – expected loss from disconnect within N months of employment end. Separate: share of accounts that survive employment exit (numerator: still active 90 days after job end; denominator: accounts whose employee left). Values left blank — inputs not in repo.	No — Must pull	Not in repo. Mobile is not the Internet engine (Root C / decisions overview); do not credit mobile adds against this line.	Expensive

8 · What would make the benefits claim credible?

Demonstrated: measured disruption or workforce outcomes in a privacy-safe pilot. Plausible: productivity language before measurement. Provisioning must not depend on monitoring browsing, health, or productivity on the connection.

ID	Metric	Gates	Definition	In repo?	Where / source	Cost
M15	Work disruption from failed home connectivity	Whether the Employee Health & Benefits productivity claim can be evidenced without monitoring the pipe	Numerator: employee-reported remote-work days with connectivity failure that blocked work (or ticketed outage hours on remote days). Denominator: remote-work days in the period. Unit: rate or hours. Opt-in survey / IT tickets only — provisioning must not depend on monitoring how employees use the connection (privacy constraint from prior analogy draft).	No — Must pull	Not in repo. Demonstrated only after a pilot; plausible before that.	Expensive
M16	Retention or recruiting lift where connectivity is offered	Whether employers see a workforce outcome worth paying for	Compare offer vs control employers (or pre/post): voluntary quit rate, offer-accept rate, or time-to-fill for hybrid-eligible roles. Unit: percentage-point difference. Separate demonstrated (measured in pilot) from plausible (hypothesis only).	No — Must pull	Not in repo. Expensive; only decisive after accounts exist.	Expensive
